Introdução

- Este trabalho tem a função de desenvolver um arcabouço para o Algoritmo Genético (AG).
- Um algoritmo de Caminhada Aleatória também é desenvolvido para fins de comparação com o desempenho do AG.

Objetivo

- A implementação tem como objetivo fazer com que tanto o AG como o Random Walk sejam capazes de acertar uma palavra-alvo de acordo seus *n* primeiros caracteres (10, 20 e 30), para populações de 50 a 100 cromossomos, ao longo de 5 execuções.
- Gráficos e tabelas são utilizados para a ilustrar os resultados obtidos.

Palavra-Alvo (Com os 30 Caracteres)
52.547, 72.15, 53.694, 57.771, 115.88, 105.59, 75.368, 126.02, 52.756, 85.1, 80.525, 111.24, 113.62, 64.95, 89.181, 85.647 , 101.71, 106.75, 110.37, 72.082, 104.38, 102.41, 63.009, 59.52, 89.869, 126.78, 77.231, 96.821, 67.905, 110.1

- Quanto a demonstração dos resultados em gráficos:

- Colocar no mesmo gráfico a evolução do RW e AG (Calcular a média e o desvio padrão por geração das R execuções do fitness do melhor indivíduo)
- Avaliar o desvio padrão das soluções finais encontras nas R execuções (precisão)
- Fazer um gráfico de barra com a média e desvio padrão de número de acertos de valores da palavra alvo
- Avaliar a média e desvio padrão do desvio da palavra encontrada da alvo (acurácia)

- Observa-se um desvio-padrão próximo de zero logo no inicio do AG, porém este valor não é zero, mas sim próximo de zero, sendo assim acaba não aparecendo no gráfico, como mostra a tabela.

Conclusão

- O AG mostrou-se eficiente para encontrar a palavra-alvo, acertando por completo em todos os testes, neste quesito o Random Walk falhou em todos.

- Neste trabalho, o AG estava inicialmente com um alto desvio-padrão a cada geração, dificultando sua compreensão. O problema foi resolvido reduzindo a taxa de mutação e desvio-padrão.

Agradecimento

- Obrigado pela atenção!
